## Worksheet for pressure distribution system design Long form with instructions and tables Rev. October 2006

This is an iterative process, so each step may have to be repeated before final design. To be used with the Design Inputs Worksheet.
Units: Worksheet and tables are in US gallons. See page 24 for conversions.

## A. Design of the Distribution Network:

1 Establish Field length
Based on loading rates and design flows select total length of dispersal unit (trench or bed). It is critical to use a field flow consistent with the flows used by the agency or person who developed the HLR table or formula that you are using. Refer to Design Inputs Worksheet and enter appropriate values below.

| SOIL TYPE |  |  |  |
| :---: | :---: | :---: | :---: |
| DESIGN HLR | LPD/SQM | $=$ | _GPD/SQFT |
| DESIGN LLR | LPD/M | $=$ | GPD/FT |
| DAILY DESIGN FLOW $(\mathrm{Q})=$ | LPD | $=$ | GPD |
| AVERAGE FLOW | LPD | $=$ | GPD |

SYSTEM LENGTH GUIDE, L minimum $=$ FIELD DESIGN FLOW $(\mathrm{Q}) \div$ LLR
$=$ $\qquad$ gal per day $\div$ $\qquad$ gal per foot = $\qquad$ FEET MINIMUM This gives a guideline for minimum overall system length (this is for ALL trenches on a slope or in an area). Note that this may differ in different areas of the field if the laterals are of differing lengths, in which case use the worst case area. Apply to flat and to sloping sites.

For bed design use LLR to determine bed length, see mound design worksheet, or for fixed width use AIS divided by width

WIDTH OF TRENCH/BED
$=$
FEET
Use decimal feet. Is AIS divided by length
NETWORK TYPE (dispersal system piping) $=\quad$ (eg trench, bed)

## 2 Establish initial trench layout, Determine lateral lengths

Based on conditions of site select appropriate trench layout and initial manifold position (eg end or center feed or no manifold). Ensure system length meets minimum required.

MANIFOLD TYPE =
Based on above determine lateral lengths and number of laterals, if there are several lengths, choose limiting lengths for initial design. Enter number of laterals in (A 6) below.

LATERAL LENGTH $=$ $\qquad$ Design individually for center feed.

NUMBER OF LATERALS = $\qquad$

## MOUNDING

If you are concerned about mounding, beyond a simple consideration of LLR consider using a computer model (eg Nova Scotia mound program). Use average flows for mounding modeling.

## SKETCH:

Draw a sketch of proposed layout, include constraints. Draw a schematic elevation showing the static head and forcemain length, fittings etc. Use pencil until finalized. Show any sub areas (ie areas of field in separate location but to be dosed at the same time) or zones (areas of field dosed separately).

3 Determine orifice size, spacing, position.
Maximum 6 sqft per orifice, ( $24^{\prime \prime}$ trench this is $36^{\prime \prime}$ spacing). Position affects dosing design. Orifice size, for type 1 effluent start with $3 / 16^{\prime \prime}$ and adjust as necessary with respect to dose volume required and pump/force main design. For soils or situations requiring frequent dosing with filtered effluent start with $5 / 32$ ". For beds, stagger orifices.

ORIFICE SIZE =
ORIFICE SPACING
$\qquad$ FRACTIONAL INCHES $\qquad$

- FEET $\qquad$
4 Determine lateral pipe diameter and pipe class Using tables LATERAL DESIGN TABLES (Page 17 onward).

LATERAL DIAMETER = $=$

INCHES
LATERAL PIPE CLASS =
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## 5 Determine number of orifices per lateral

Divide orifice spacing from (A 3) above into lateral length from (A 2) above, and round to nearest whole number. Based on orifices spaced min. $1 / 2$ of spacing from ends of infiltrators or trenches, and no reduction in trench length for center feed. If your specification differs, adjust number.
$\qquad$ $\mathrm{ft} \div$ $\qquad$ ft ) + $\qquad$ $=$ $\qquad$

ORIFICES PER LATERAL =
6 Determine lateral discharge rate
Select distal pressure (pressure at last orifice of longest lateral), minimum is 3 feet for $3 / 16^{\prime \prime}$ and larger or 5 feet for $1 / 8$ and $5 / 32$ " orifices. This is the "Squirt Height".

DISTAL PRESSURE = $\qquad$ FEET $\qquad$
Orifice discharge from ORIFICE DISCHARGE RATE DESIGN TABLE (page 13), or calculation.
ORIFICE DISCHARGE $=$ GPM
Orifice discharge x number of orifices per lateral from (A 5) above to give
LATERAL DISCHARGE $=$ GPM
CENTER OR END FEED? = $\qquad$
$\qquad$
NUMBER OF LATERALS = $\qquad$

For trench design spacing at 6 or 10 feet, for beds per design. Use information in (A 2) above.
SPACING BETWEEN LATERALS = feed)

MANIFOLD LENGTH = $\qquad$ FEET

## 8 Calculate manifold size

Using information from (A 2) and (A 7) determine manifold length and then use MAXIMUM MANIFOLD LENGTHS tables (pages 22 and 23) to select minimum manifold size, using lateral discharge from (A 6) above, Orifice size from (A 3) above and lateral spacing from (A 7) above. For center feed, flow per lateral on either side of manifold is used in table.

MANIFOLD SIZE = $\qquad$ INCHES $\qquad$

## MANIFOLD PIPE CLASS

## 9 Determine distribution network discharge rate

Multiply lateral discharge rate from (A 6) above x number of laterals from (A 6) above, check against total number of orifices X orifice discharge rate.

NETWORK DISCHARGE RATE = $\qquad$
TOTAL NUMBER OF ORIFICES $(\gamma)=\quad \mathrm{X} \quad$ gpm $=\ldots$ GPM
At this point, iterate (repeat) until reasonable flow and manifold size results based on your experience. Adjustments may include reducing orifice size, changing manifold location, manifolding laterals at a central location, splitting to zones. More than one option may be retained for comparison at the next stage- use separate worksheets and number options as required, destroy or label as not used options that you do not use in the final design.

## B. Design of the Force Main, Pressurization Unit (Pump or Siphon), Dose Chamber and Controls.

## 1. Develop a system performance curve.

Determine approximate network head requirement by multiplying Distal pressure (from (A 6) above) x 1.31. This is based on assumption of a household sized system, constructed with normal manifold and lateral layout and normal fittings, if your design varies, adjust accordingly.

Determine static head, from off float of pump chamber to highest point of network.
If negative take steps to prevent siphoning of pump chamber and, if this is by using an orifice in the discharge piping in the pump chamber, add orifice discharge rate (based on orifice size) to pump discharge and use orifice head ( 3 feet min) plus lift from pump chamber plus 3 feet min( to avoid negative pipe pressures) subtracted from value of negative elevation difference as static head.
For sloping sites and simplified design base Static Head requirement on highest lateral. Consider this when selecting pump.

STATIC HEAD (Indicate if anti siphon required) = FEET SIPHON?

NETWORK DISCHARGE (from (9) above) $=\ldots$ GPM
NETWORK 2 DISCHARGE (if more than 1 sub area or zone 2 ) $=\quad$ GPM
NETWORK 3 DISCHARGE (if more than 1 sub area or zone 3) $=\quad$ GPM
NETWORK 4 DISCHARGE (if more than 1 sub area or zone 4) $=\quad$ GPM Add more as required.

ANTI SIPHON/PRIMING ORIFICE DISCHARGE (if used) $=\ldots$ GPM
PUMP DISCHARGE Required
$=$
GPM
Sum of maximum network discharge (largest zone) (only add secondary network discharges together if they are sub areas rather than zones-since zones discharge separately) PLUS anti siphon or pump priming orifice discharge. If you have sub zones you may need to add a sheet to address subsidiary forcemains.

Determine friction loss in force main (transport line to field), first select initial force main sizing, use manifold size or next pipe size up. Can use pipe velocity guide (page 16) to select forcemain initial size Base on maximum network discharge.

Check that flow velocity is over 2 and under 10 feet per second using table FRICTION LOSS IN PLASTIC PIPE (page 14) assuming use of PVC sch 40, then use that table to provide head loss for force main based on system discharge and length,. Add equivalent length for fittings as required from EQUIVALENT LENGTHS OF FITTINGS Tables (page 15). OR use other friction loss/flow velocity calculation. Note that for end suction pumps it is necessary to also consider losses in the suction piping and fittings, using the same methods.

FORCE MAIN LENGTH $\alpha=$

FORCE MAIN DIAMETER
$=$ $\qquad$ INCHES
FORCE MAIN TRUE INTERNAL DIAMETER =
Only required if not using Sch 40 pipe and the table.

| Fittings used, including <br> size. | Number | Equivalent length per <br> fitting | Total equivalent length |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |

## FITTINGS EQUIVALENT LENGTH $\quad \beta \quad$ FEET

TOTAL EQUIVALENT LENGTH $(\alpha+\beta) / 100=\mathbf{L}=\ldots$ FEET / 100
HEAD LOSS PER 100' (from table) $\qquad$ $\mathrm{Ft} / 100 \mathrm{ft}$

FRICTION LOSS IN FORCE MAIN $=$ $\qquad$ FEET
This is Head loss per 100' times Total Equivalent Length (L).
SUCTION HEAD LOSS (if applicable) =
FEET
Repeat if required for the suction lines. Ensure no cavitation. Use manufacturer's data for loss in pump intake for end suction pumps.

SUCTION LIFT (if applicable) =
$=$
FEET
NET POSITIVE SUCTION HEAD REQUIRED (NPSH) = $\square$
$\qquad$ FEET Add lift plus suction head losses.

## CHECK FLOW VELOCITY

$=$
FEET PER SECOND
If not using PD table. V= Flow (cu ft per second) / cross sectional area of the inside of the pipe (sq ft ).

TOTAL DYNAMIC HEAD REQUIREMENT TDHR = FEET
This is Static Head + Network Head requirement + Friction Loss In Forcemain(s) + NPSH
PUMP DISCHARGE/HEAD
$=$
GPM AT $\qquad$ FEET HEAD
Develop more than one option if required, to examine impact of changes to network, piping, pump type etc.

ADDITIONAL SECTIONS OF FORCEMAIN, ZONE VALVES, EXTRA ORIFICES
Where there are parts of the focemain at different diameters, or if you are using a zone valve and attendant fittings (perhaps at a different diameter also) add an extra sheet to develop head loss figures for these and add them in to the TDHR. Also use to develop head losses for these at the various flows for the system head curve.

## 2 System curve

Use step 1 several times for discharges either side of the system discharge (if orifice Distal pressure was based on the minimum required squirt height use mainly discharges above the theoretical discharge) to generate a system curve. This takes into account the real world as far as available pumps are concerned to show the operating points for various pumps by plotting the system curve on transparent paper and overlaying various pump curves. This will also point up any calculation errors and give you a graphical representation of the various head requirements of the system. Note that for each new discharge a different Distal Head and thus a different Network Head Requirement is generated based on the orifice flow calculations. Pick discharges that match the increments in the ORIFICE DISCHARGE RATE DESIGN TABLE , or use calculation. To facilitate this process, express total flow as equivalent flow per orifice (ie. Flow divided by number of orifices). Remember to add pump chamber office flow (if used) to give total flow, and add in losses at the network flow for additional sections of forcemain, zone valves etc.
NUMBER OF ORIFICES =
( $\gamma$ ) From (A 9) above.

TOTAL EQUIVALENT PIPE LENGTH (L) =
FT/100 From (B 1) above.

| Squirt height <br> (Distal <br> Head) | Orifice flow at squirt height | Network discharge = (flow per orifice $\mathrm{x} \gamma$ ) | Pump/anti siphon orifice discharge, if used | Friction factor (ft loss per 100') | Force main(s) head loss $(\mathrm{ft})=$ friction factor $\times \mathbf{L}$ | Network head required (1.31 X squirt ht.) (ft) | Static head (ft) plus other losses | TDHR <br> (ft) | Total flow $(\mathrm{gpm})=$ network discharge + pump orifice (if used) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |

Static head stays the same for all cases except for if using an anti siphon orifice. Add NPSH if necessary, use separate sheet for zone valves, extra forcemains etc.

Use pump curves and system curves to select pump and determine operating point. Be careful to avoid undesirable pipeline velocities (too high or too low). Ensure pump will provide minimum required squirt height.

## ITERATE UNTIL PUMP AND FORCEMAIN ARE ECONOMIC.

PUMP SELECTED =
Voltage and max. current: $\qquad$

Discharge diameter: $\qquad$ Height: $\qquad$ $\mathrm{ft} \quad$ Minimum water level: $\qquad$ ft (Recommended is full pump ht, often $\min$. is $1 / 2$ pump motor submerged).

OPERATING POINT
$=$
GPM at $\qquad$ FT head.
Include manufacturer, series, part number, pump voltage, discharge diameter and HP rating. For larger pumps record breaker size and switch capacity (or magnetic starter) required (do not use breaker larger than pump locked rotor amperage).

## 4 Determine dose volume

Based on soil type select type of dosing and minimum/desired dose frequency.

| Dosing frequency (minimum) | Soil type |
| :--- | :--- |
| Timed dosing | Coarse sand, gravels, sand mounds etc, certain clays |
| 4 X per day | Medium sand, fine sand, loamy sand, Sandy Clay, silty clay or clay |
| 2 X per day | Sandy loam, Loam, Silt Loam, Clay Loam |

TYPE OF DOSING (demand or timed) =
DOSE FREQUENCY $=\min$ times per day
Determine dose volume, by dividing frequency into DAILY DESIGN flow (from $\mathrm{A}(1)$ ). For more conservative design, use AVERAGE flow
$\qquad$ gpd $\div$ $\qquad$ times per day

DOSE VOLUME = $\qquad$ GALLONS

Check dose volume against draining volume of network and any part of force main that drains. Ensure dose volume is minimum 5 x the draining volume. If not, consider constraints (soil type etc) and redesign manifold location etc to achieve this. Use VOLUME OF PIPE table, page 16.

VOLUME OF LATERALS (if draining) $=\quad$ ft x ___ gallons per $\mathrm{ft}=$ $\qquad$ Total length of laterals x volume per foot.

DOSE VOL. $\div$ TOT DRAINING VOL. $=$ $\qquad$ $\mathrm{G} \div$ $\qquad$ G = $\qquad$ (min. 5)

Check pump run time per dose is within manufacturer specifications for minimum run time, often 2 mins. Consider using twin smaller pumps ( 0.5 HP or less) if very short run time is needed.

PUMP RUN TIME $=$ Dose volume $\div$ Pump flow rate

$$
=\quad \mathrm{G} \div \ldots \quad \mathrm{GPM}=\quad \text { MINS }
$$

Note that in climates where freezing may occur in undrained laterals it may be difficult to attain very small doses. Use smallest dose/most frequent dosing possible.
Note other steps to be taken to improve distribution, pump constraints.
Notes: For lateral hole positions, draining and distribution:

## 5. Size pump vault

SPM guideline for small systems; minimum vault sizes for demand activation volume 1 day design flow, for timed dosing 2 times daily design flow. Timed dosing worksheet is also available.

DESIGN FLOW = $\qquad$ GPD From section (A 1), peak flow
DOSE VOLUME
$=$
GAL From (B 4)
For time dose this is the timer allow volume.
RESERVE VOLUME $=$

GAL To alarm float from pump on float level. Minimum $15 \%$ of peak flow for demand dosed systems, per design for timed dose (Minimum 67\% peak flow with timed dose for small systems with lag/override operation).

RESERVE VOLUME TO LAG FLOAT = _ GAL For timed dose systems only.
ALARM RESERVE VOLUME = can occur during power outage or in remote area, this may also include reserve volume provided by surcharge of the septic tank.

TOTAL MINIMUM VOL. $=$ GAL Estimate pump chamber size for initial design trial.

PUMP VAULT(S) SIZE(S)
Nominal size and manufacturer designation.

With effluent filter spacer is only required to prevent rock chips etc from entering pump. Some pumps have suitable legs.

Use this information and the float setting worksheet (below) or timed dosing worksheet to determine float or other control setpoints. Ensure the above volumes will fit in the vault, iterate until satisfactory.

PUMP CONTROL FLOAT =
If direct control, ensure float is of sufficient capacity.
FLOAT TETHER LENGTH = $\qquad$ INCHES

SEPTIC TANK SURCHARGE FOR ALARM VOL. $\qquad$ (If used)

PUMP CHAMBER "V" VALUE = $\qquad$ FT/USGAL

After installation check that the floats switch as designed. Mark "V", float types, heights, ranges (including tether lengths if required) and dose volume on headworks for future reference. Can use more than one vault to make up required volume. With large vaults can specify smaller pump sub vault to allow float control.
NOTES:

## Calculating the Dose Volume For Systems Designed to Drain Back to Pump Chamber:

When draining system back to pump chamber, the volume of effluent in the manifold and transport pipe must be added to the dose volume and considered when sizing the pump chamber Use VOLUME OF PIPE table, page 16.

If only part of the system drains back, use appropriate pipe lengths.
Volume in manifold $=$ manifold length x volume in gallons per foot
Volume in manifold $=$ $\qquad$ GAL

Volume in Transport Pipe $=$ Transport pipe length x volume in US gallons per foot
Volume in transport pipe $=$ $\qquad$ GAL

Total drain back volume $=$ Manifold volume + Transport pipe volume
TOTAL DRAINBACK VOLUME = $\qquad$ GAL Add this volume to dose volume and use per dose volume in worksheet.
$\qquad$ DATE $\qquad$
TANK SELECTED $\qquad$ UNITS usgal/feet

INTERNAL FLOOR AREA $=(\mathrm{L}-2 \mathrm{X}$ wall thickness $) \mathrm{X}(\mathrm{W}-2 \mathrm{X}$ wall thickness $)=$ $\qquad$ SQ FEET VOLUME IN ONE FOOT OF DEPTH = $\qquad$ CU FT $\times 7.48=$ $\qquad$ US G PER FOOT "V" $=1 \div$ VOLUME PER FOOT $=1 \div$ $\qquad$ $=$ $\qquad$ FEET PER US GALLON
"V" X VOLUME = HEIGHT

$$
\text { HEIGHT } \div \text { "V" = VOLUME }
$$

CU FT X $7.48=$ US GALS $\sim$ CU IN X $0.00433=$ US GALS
CU METERS $\times 1000=$ LITERS $\sim$ INCHES $\times 0.0254=$ METERS

## Orifice Discharge Rate Design Table

The following figures are guidelines based on Toricelli's equation. The orifice coefficients used are intended for use with sharp edged orifices in plastic pipe, with experience of your orifice drilling technique adjust accordingly. Figures in italics are below the recommended minimum head.

| Orifice Discharge Rates (GPM) |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Squirt height <br> (Head) (ft) |  |  |  |  |  |  |
|  | $1 / 8$ | $5 / 32$ | $3 / 16$ | $7 / 32$ | $1 / 4$ |  |
| 1 |  |  | 0.43 | 0.58 | 0.77 |  |
| 2 | 0.26 | 0.41 | 0.61 | 0.82 | 1.09 |  |
| 3 | 0.32 | 0.51 | 0.74 | 1.01 | 1.34 |  |
| 4 | 0.37 | 0.59 | 0.86 | 1.17 | 1.55 |  |
| 5 | 0.42 | 0.65 | 0.96 | 1.30 | 1.73 |  |
| 6 | 0.46 | 0.72 | 1.05 | 1.43 | 1.89 |  |
| 7 | 0.50 | 0.77 | 1.13 | 1.54 | 2.05 |  |
| 8 | 0.53 | 0.83 | 1.21 | 1.65 | 2.19 |  |
| 9 | 0.56 | 0.88 | 1.28 | 1.75 | 2.32 |  |
| 10 | 0.59 | 0.93 | 1.35 | 1.84 | 2.45 |  |
| 11 | 0.62 | 0.97 | 1.42 | 1.93 | 2.57 |  |
| 12 | 0.65 | 1.01 | 1.48 | 2.02 | 2.68 |  |
| 13 | 0.68 | 1.05 | 1.54 | 2.10 | 2.79 |  |
| Coefficient | 0.61 | 0.61 | 0.62 | 0.62 | 0.63 |  |
| used |  |  |  |  |  |  |

Orifice discharge rates can be calculated using Toricelli's equation:

$$
Q=C_{d} A_{0} \sqrt{2 g h}
$$

Where: $\mathrm{Q}=$ the discharge rate in $\mathrm{ft}^{3} / \mathrm{sec}$
$\mathrm{C}_{\mathrm{d}}=$ the discharge coefficient (unitless)
$\mathrm{A}_{0}=$ the cross sectional area of the orifice in $\mathrm{ft}^{2}$
$\mathrm{g}=$ the acceleration due to gravity ( $32.2 \mathrm{ft} / \mathrm{sec}^{2}$ )
$\mathrm{h}=$ the residual pressure head at the orifice in ft

Head loss in PVC pipe, table Based on table in Converse (2000)

| Flow (usgpm) | Nominal pipe size in inches, PVC pipe sch 40. For headloss in feet per 100' of pipr |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Guideline pipeline flow velocities

- Safe design velocity 5 feet $/ \mathrm{sec}(1.5 \mathrm{~m} / \mathrm{s})$
- Minimum scouring velocity 2 feet/sec
- Do not exceed 10 feet/sec even in short pipelines

## Manifold design tables based on Washington State design manual

These tables can be used to determine maximum manifold lengths for various manifold diameters, lateral discharge rates and lateral spacings. For 6" manifolds see Washington State design manual.

The maximum lateral lengths were developed to assure there will be no more than a $10 \%$ variance (drop) in the discharge rates between the proximal and distal orifices in any given lateral. The maximum manifold lengths in the tables below were developed to assure there will be no more than a $15 \%$ variance in discharge rates between any two orifices in a given distribution system (assuming the system is designed using the above procedure and tables). These tables are quite conservtative.

Two assumptions used to develop these tables are: (1) the maximum variance in orifice discharge rates within a network occurs between the proximal orifice in the first lateral connected to a manifold and the distal orifice on the last lateral connected to the manifold and (2) the friction loss that occurs between the proximal orifice of a lateral and the point where the lateral connects to the manifold is negligible. If your fittings are not normal, additional network head loss may need to be considered.

For marginal situations consider use of series 200 pipe. For situations where feeder pipes are used from a short manifold, design using head loss calculations, on sloped sites the slope assists where top fed feeder pipes are used.

Note that the Central Manifold discharge rates are $1 / 2$ the end fed rates-this is because the discharge is PER LATERAL, and with a central manifold there are 2 laterals per lateral spacing.

Instructions:
Example A: Central manifold configuration, lateral discharge " Q " $=40 \mathrm{gpm}$ (this is discharge for each lateral, one both sides of the center manifold), lateral spacing $=6 \mathrm{ft}$., manifold diameter $=4$ inch; Maximum length $=18 \mathrm{ft}$.

Example B: End manifold configuration, lateral discharge "Q" $=30 \mathrm{gpm}$, lateral spacing $=6 \mathrm{ft}$., manifold length $=24 \mathrm{ft}$; Minimum diameter $=3$ inch

Round flows to nearest number in table.
Make sure you are using the table that matches your orifice size!
